

File -1(server side)

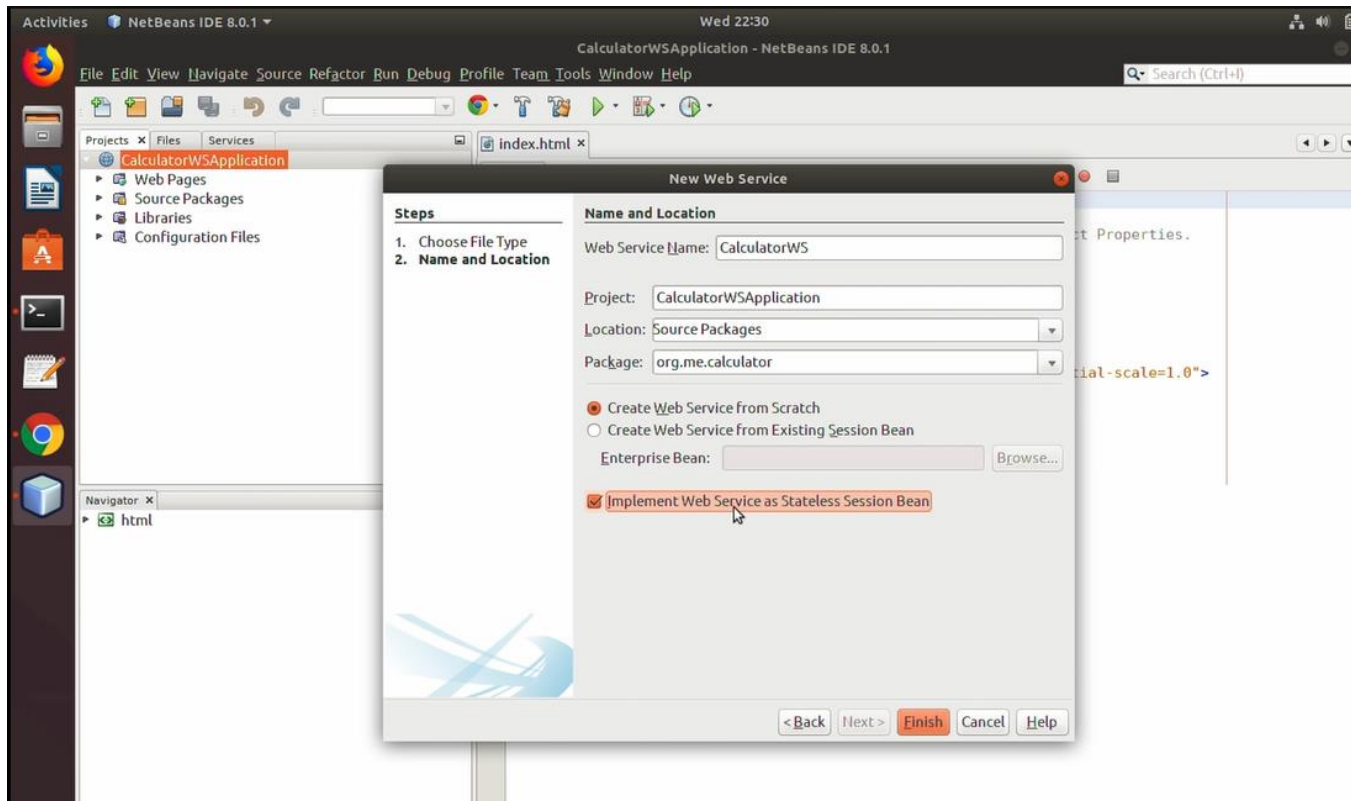

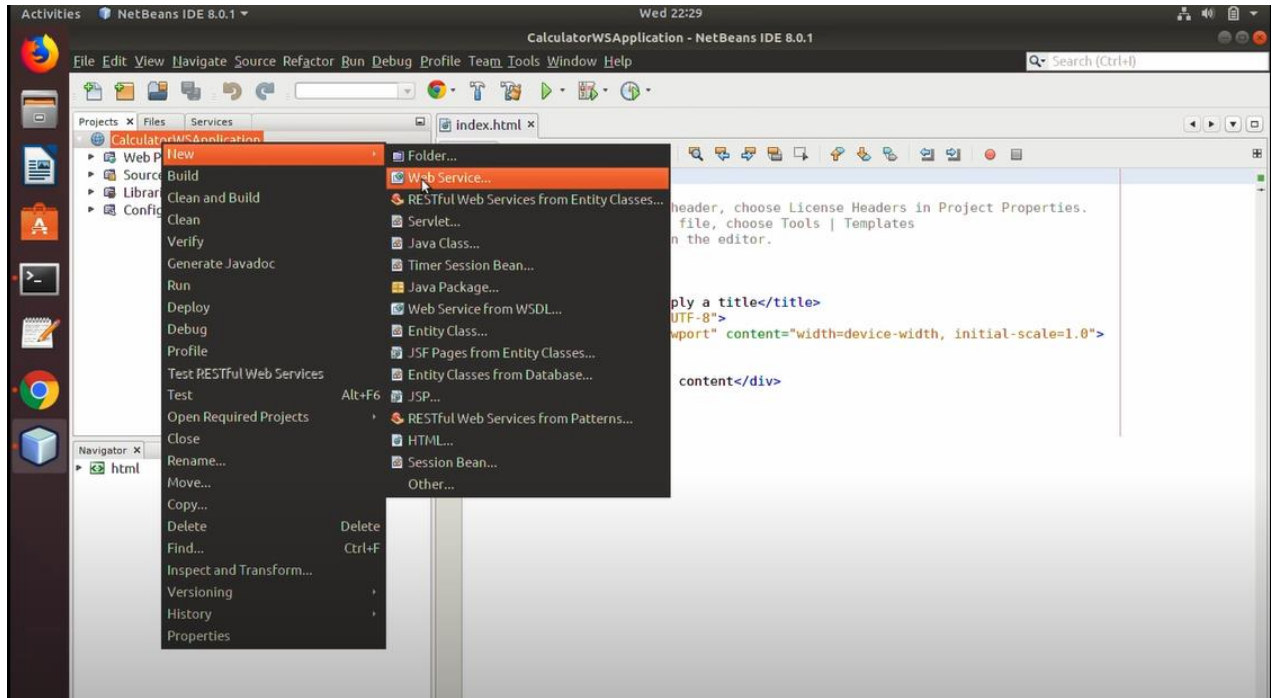

1) Download net-beans(version 13)

2) Go to file ->new project->java web->web application->fill details(proj name) ->finish.

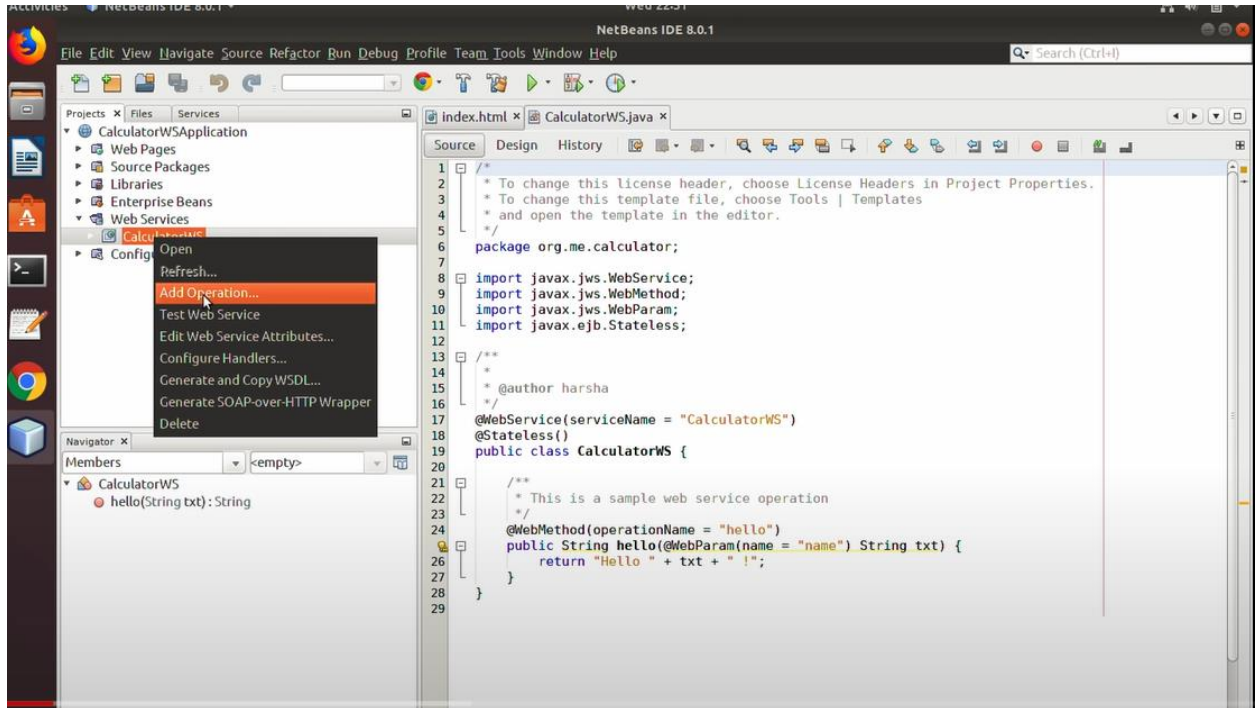

3) Right click on created project -> NEW->Web Service->add web service name->add package as(org.me.string)->click checkbox ->finish.

4) We can add operations under webservice folder(created)->add name of the operation(stringops) ->add parameters (Add variable, set their data type and return type) as per requirements.

(Likewise we can add one by one operation/function as per requirement in this way)

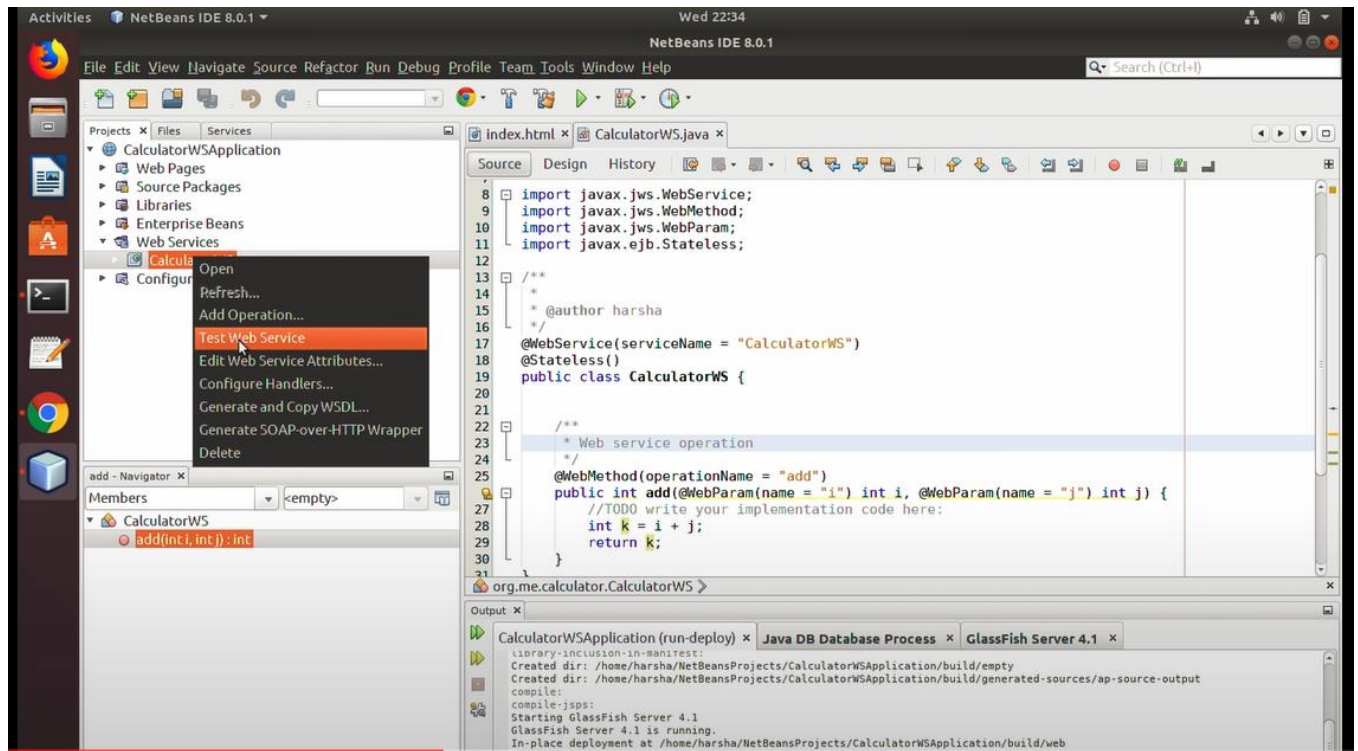

5) Add our logic to newly created stringops file.

6)Right click on NewWebApp(created file) ->Deploy

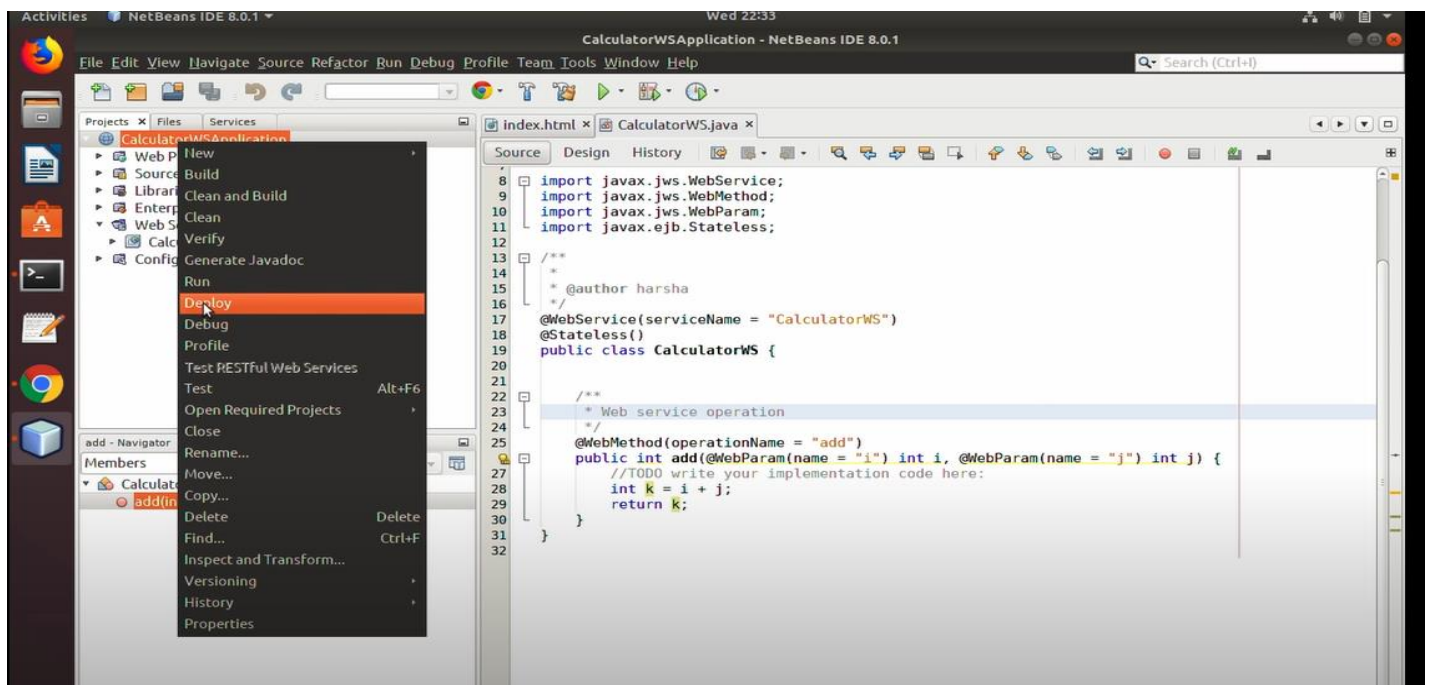

7) After deploy we can check output tab and under that server we can see where the server is listening.

8) Very important - After every change do deploy for reflecting the changes.

(Optional)- 9)after deploy go to string application which is available in folder Web Services

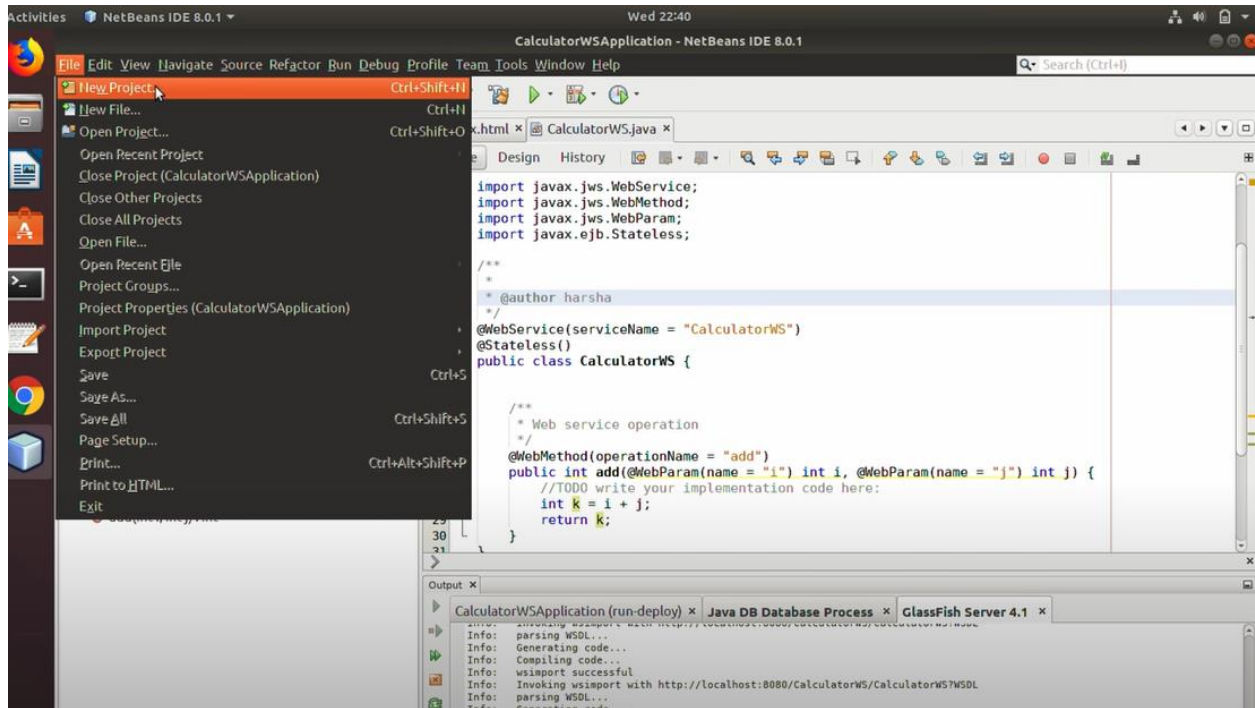

.->right click on string application and click on test services to test the web service is deployed or not.

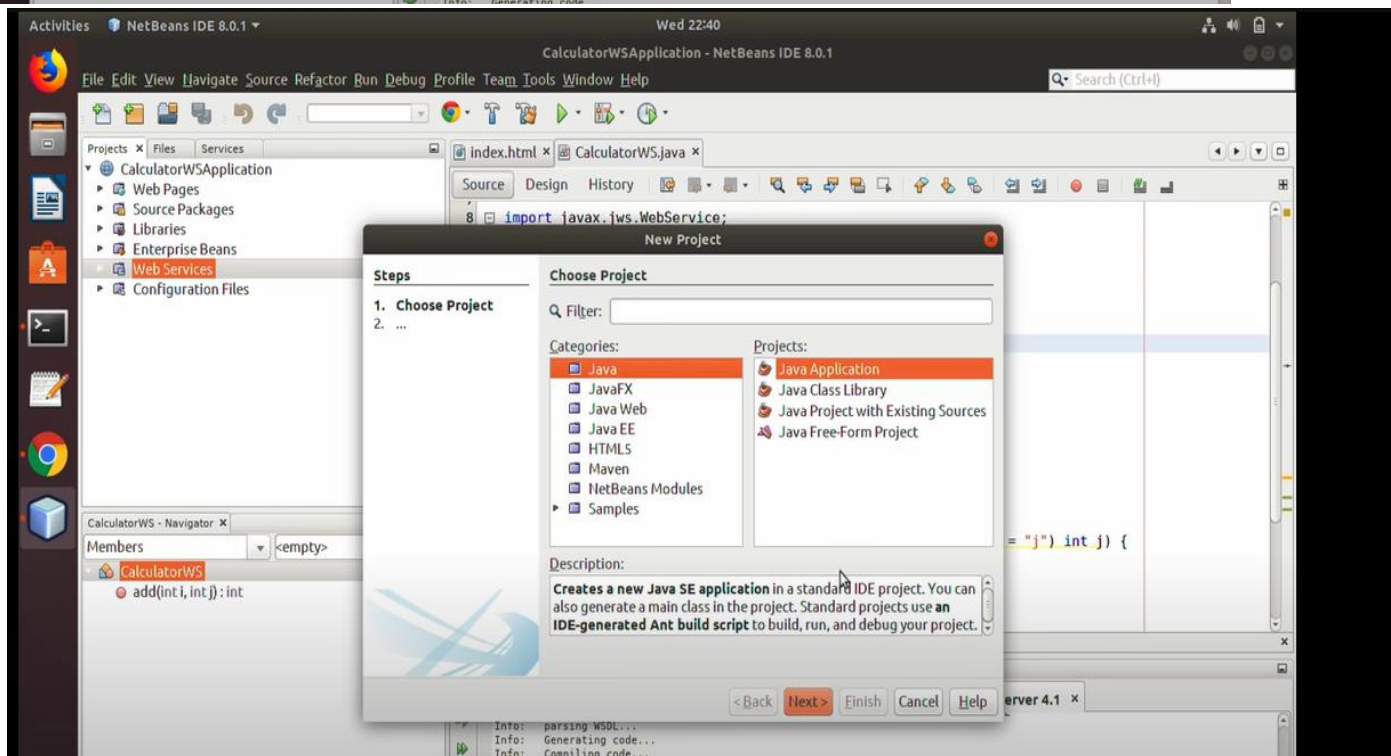

File-2(Client side):

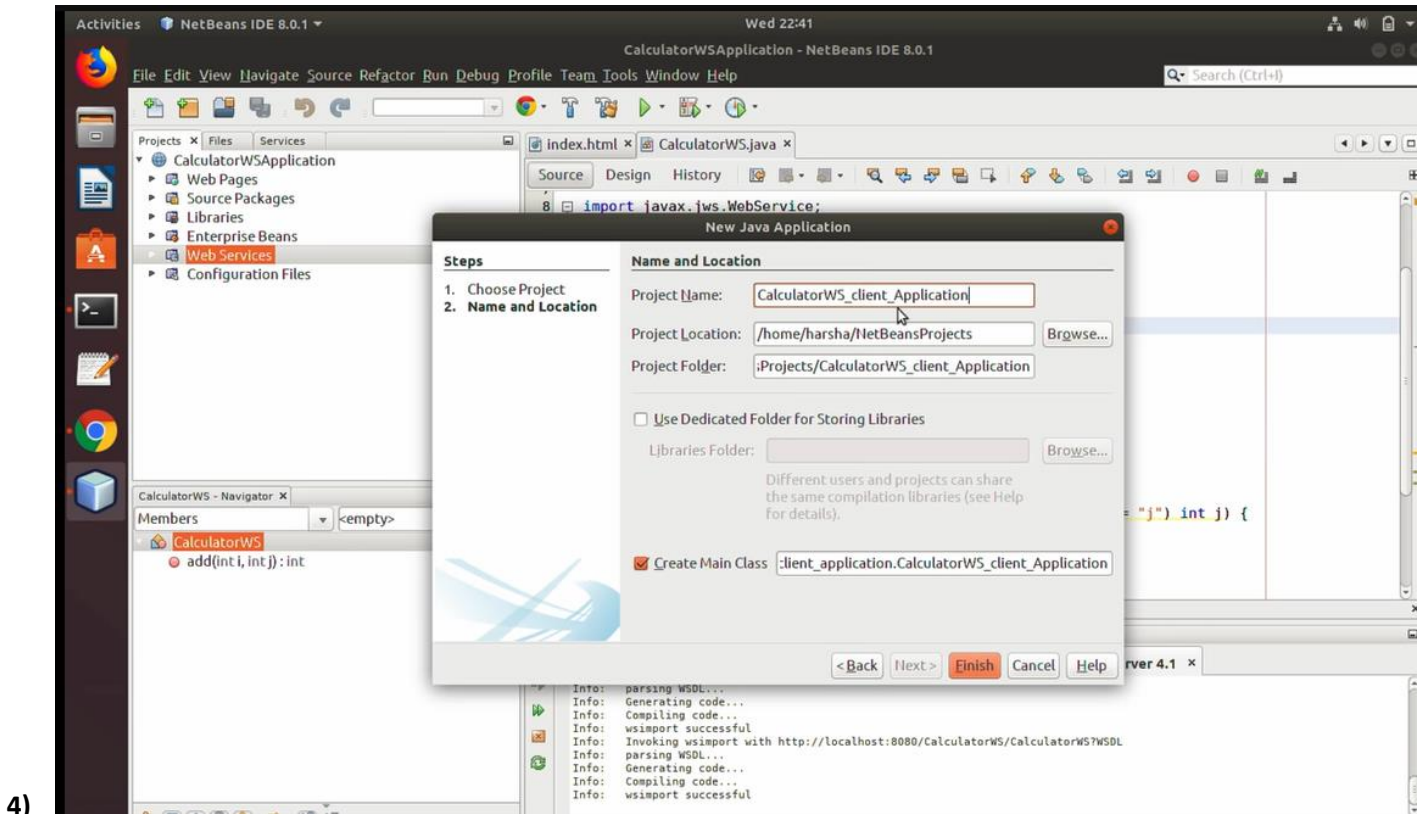

- 1) Ggo to file ->new project->java ->web application->fill details(give project name- new_webApp clientApplin) ->finish.

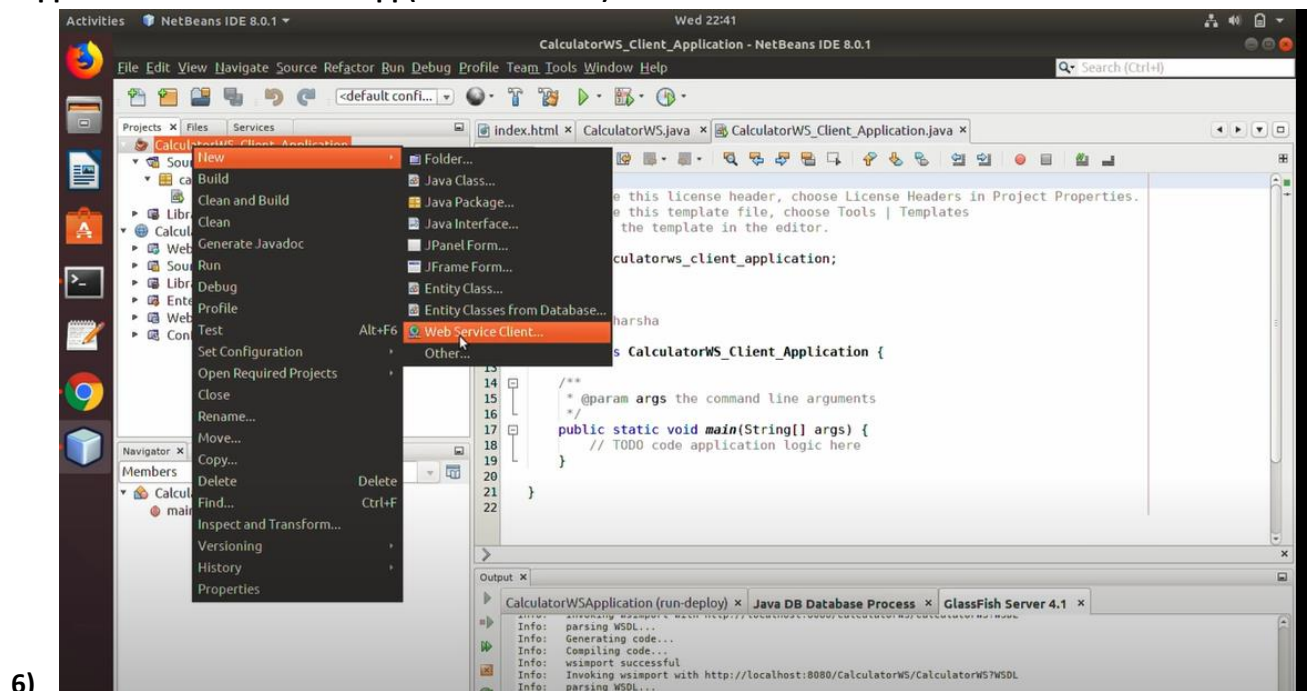

2)

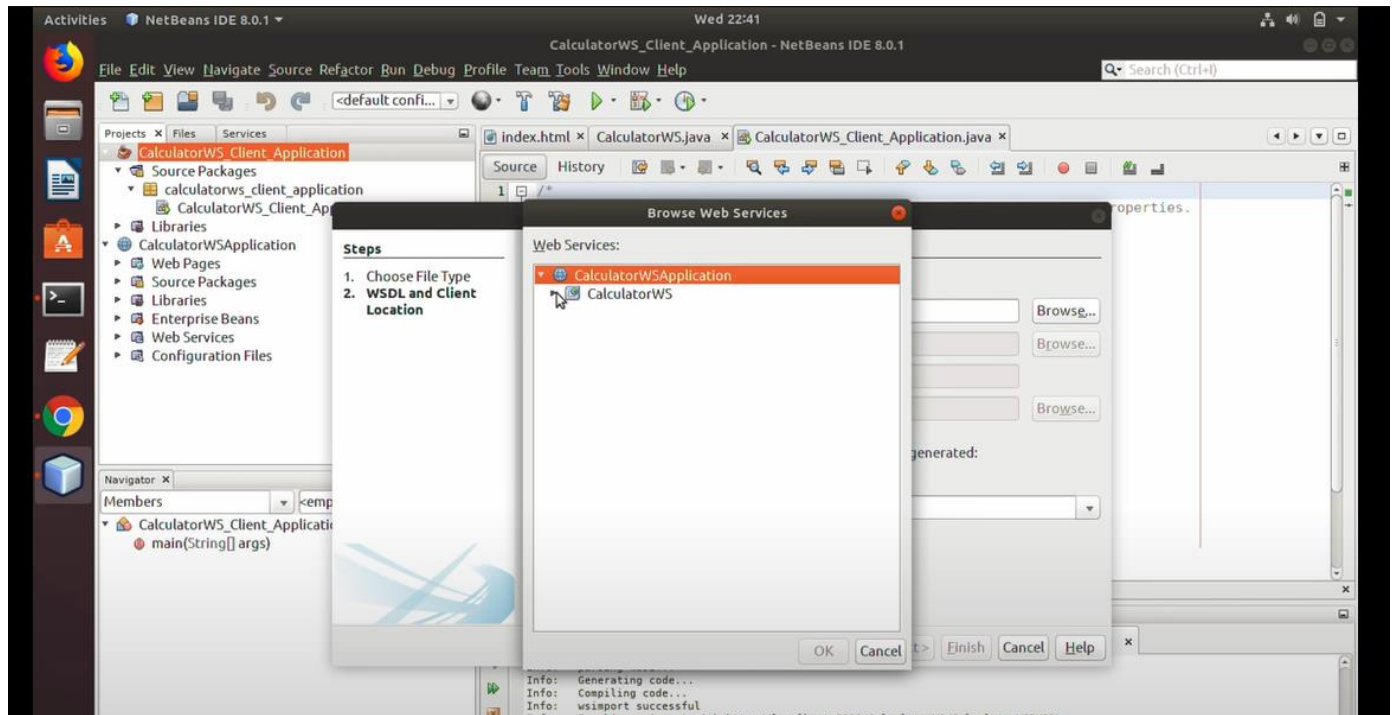

3)

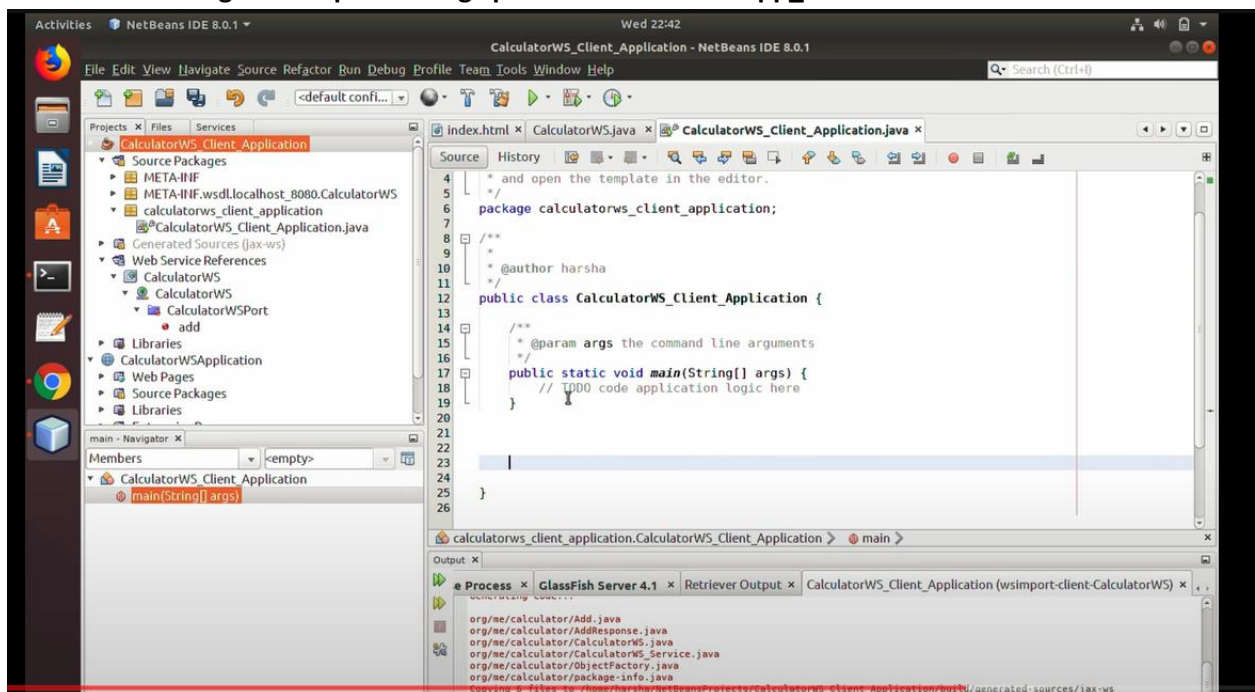

- 5) Right click on new_Web_client App ->NEW->Web Service Client->browse the project and select String application under NewWebApp(earlier created).->Ok->finish.

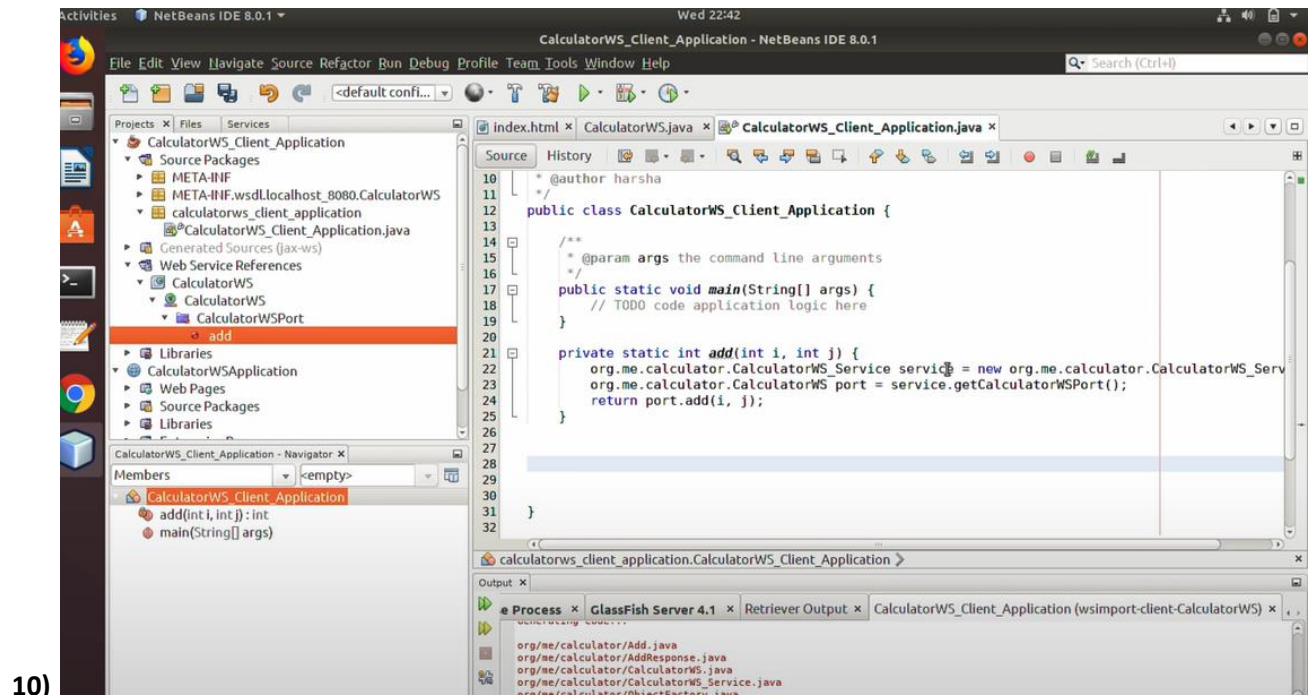

7)

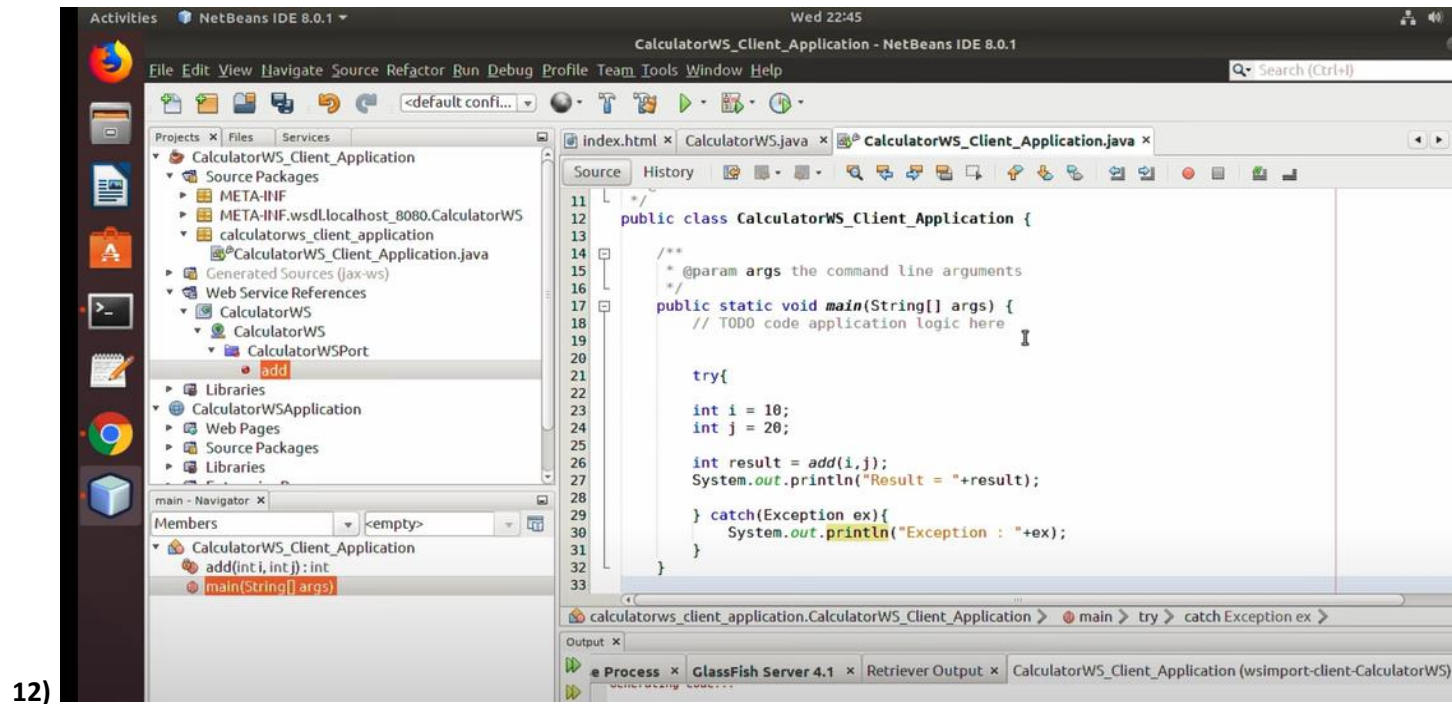

8) Web Service references created -> go on deconstructing the folder until the stringOps and then drag and drop the stringOps file into NewWebApp_Client file.

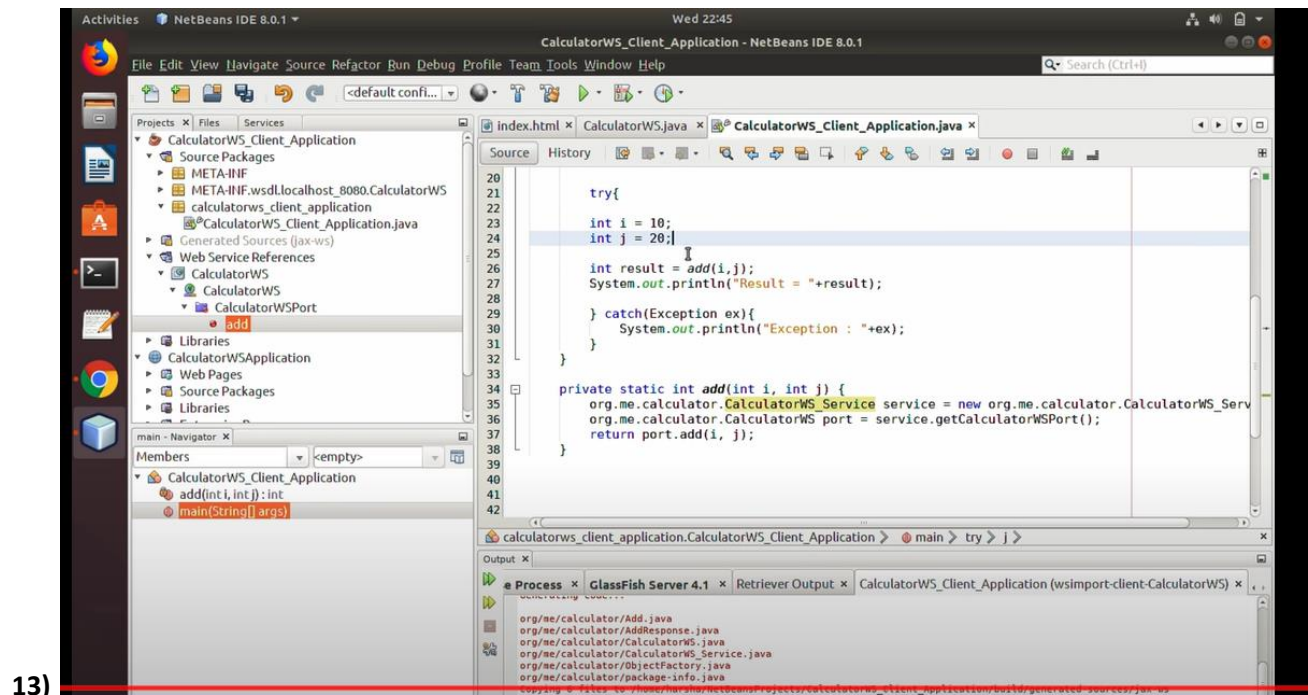

9)

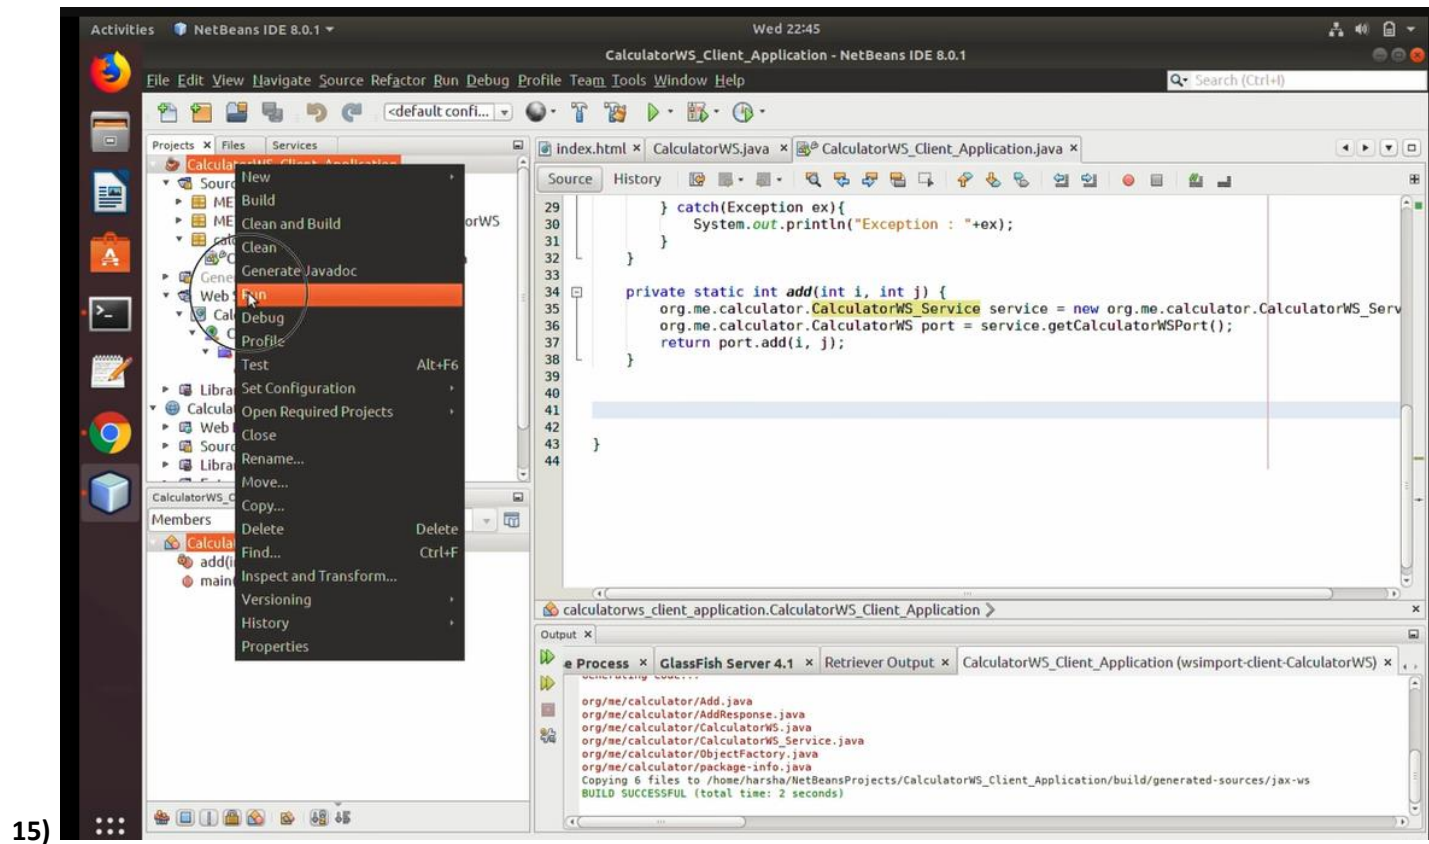

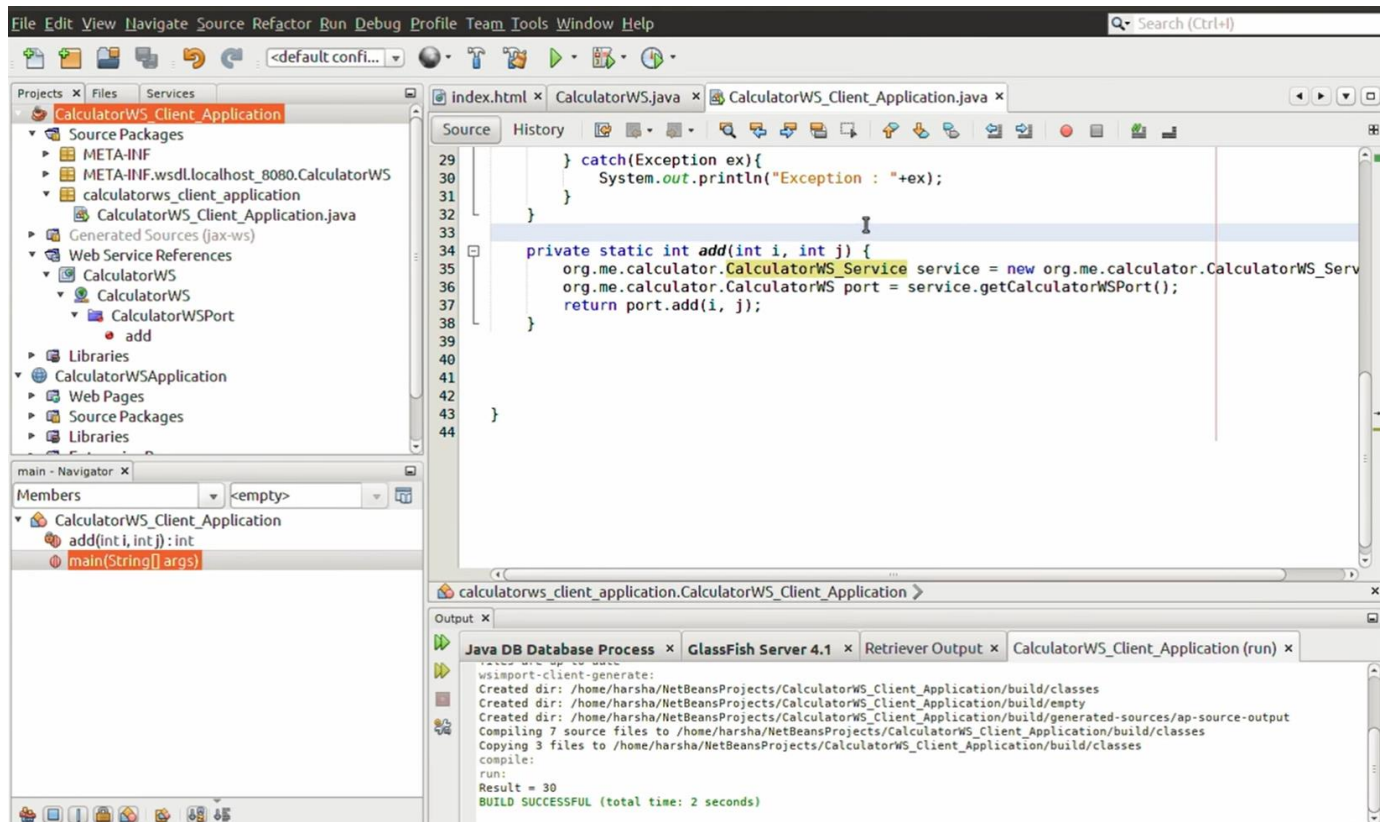

11) Update the code and call the operations.

14) Right click on client file(into NewWebApp_Client) and run .

16)
